Lab 2

Task 1:

Initializing registers.

```
1  .data
2  A: .word 21, 50, 63, 72, 0, 95, 11, 28, 4, 5, 16, 7
3
4  .text
5  .globl main
6
7  main:
8      la $s0,A    # array A
9      li $s1,12   # Length of array A
10     li $s2,1    # var i (initialized at 1)
11     li $s3,0    # var j
12     li $s4,0    # var v
13     li $t0,0    # address of A[i]
14     li $t1,0    # address of A[j]
15     li $t2,0    # value of A[i]
16     li $t3,0    # value of A[j]
17
18
```

Main initializing description:

- \$s0 – set to address of arr A
- \$s1 – set to length of arr A = 12
- \$s2 – Set to 1 to initializing var i

Next, the use of branches:

Loop 1 & Loop 2 branch:

Loop1:

```
sll $t0, $s2, 2    # shift left obj in $s2 left by 2, puts result into $t0
add $t0, $t0, $s0  # adds $t0 to $s0
lw $s4, 0($t0)     # loads A[i] into v
addi $s3, $s2, -1  # j = i-1
sll $t1, $s3, 2    # shifts object in $s3 left by 2, puts result into $t1
add $t1, $t1, $s0  # Adds $t1 to $s0 to get A[j] in $t1
```

Loop2:

```
lw $t3, 0($t1)     # Adds 0 to $t1 to get an addy, puts val of A[j] -> $t3
blt $t3, $s4, Break # Branches to break if $t3 < $s4
sw $t3, 4($t1)     # Adds 4 to $t1 to get addy of A[j+1] and stores in $t3
addi $s3, $s3, -1  # --j
addi $t1, $t1, -4  # keeps mem access consistent to j
bge $s3, $zero, Loop2 # conditional branch to loop2 if $s3 >= 0
```

Break branch:

Break:

```
sw $s4, 4($t1)     # A[j+1] = v
addi $s2, $s2, 1   # ++i
blt $s2, $s1, Loop1 # Branches to loop1 if $s2 < $s1
```

Exit:

```
li $v0, 10         # load exit op
syscall            # exit
```

return 0;

Results after executing task 1:
